

SITE VISIT INFORMATION

CDM Smith is conducting site visits to help your water system with the identification of materials for previously unknown water service lines. To properly investigate and identify the water pipe materials, we may need access to your property. We may need to be in the front yard, back yard, or inspect the exterior of the house depending on the location of the water meter and the configuration of your home's connection to the water system.

If you are not comfortable with our team accessing your property to verify your service line material, we can provide directions for how you can conduct this investigation yourself.

Please note that this site visit is not related to water quality. If you have questions regarding water quality, you can reach out to your water system's administrator or operator.

LEAD AND COPPER RULE INFORMATION

EPA Region 9 has contracted with CDM Smith to assist in helping small water systems in California meet the updated requirements of the Lead and Copper Rule Revisions (LCRR) under the Safe Drinking Water Act. This rule addresses human health concerns associated with lead in drinking water. As part of this contract, CDM Smith will be working with communities on updating their Lead Service Line (LSL) Inventories for the state of California.

To comply with the LCRR, all community and non-transient non-community public water systems were required to submit a service line inventory to identify the materials for both public-owned and private-owned services in their water service area up to and including the connection in the house, regardless of ownership, by October 16, 2024. Although this deadline has passed, the inventory is to be resubmitted with the materials identified. Our assistance is free of charge, as this program is funded by the EPA and California State.
